I owned the 4.0 version of Lightroom when it arrived on the scene and I quickly settled on it as my preferred lightroom. And then the 5.0 came out. The only real complaint I had was with the Nikon raw converter. if you shoot Nikon, this is a great camera, but unless you like using Nikon's proprietary raw converter, it's a pretty crappy experience. (You can download it for free from Nikon's site, but it's a pretty stupidly complicated piece of software.) While Lightroom still has a lot to offer, it no longer has just two owners (well, I guess it still does, there's always one version of Lightroom in the App store); now it has a slew of different users who use it globally throughout the world. It is important to understand that for the Adobe guys, Lightroom is an app, not a single app or a program. It's a set of apps, some built within Adobe, some "Third-Party Plugins", and it's apps that have a global footprint. And much like an app, any update to Photoshop is usually a hugely complicated hack of features (the latest update to the CC 2018 was a whopping 96 changes!). You can expect this to continue. You can find many tutorials on the web, most of which overlap each other and don't always make sense. It is important to have a good understanding of the manuals to understand what and why you're doing (and why not!) the things you're doing. When I first got into Lightroom, I found it almost impossible to understand anything when I first looked at a screen, so I got a keyboard shortcut keyboard and started up a fresh, clean project and printed out my first shots. I spent hours going through the tutorials on the Home pages and on various forums. The best thing to do is to do it your way to find out who you are. Some people prefer to use presets for every job, others prefer to do it the hard way and learn what Lightroom can do and how it can do it. That's the beauty of learning a new software: you can do it your own way. This will not only help you learn, but it's a hands-on approach that will eventually leave you with superior skills beyond a preset.

You can change the size and hardness of the eraser tip to achieve a variety of effects, like blending and fades. The Background Eraser uses differences in color to help you erase unwanted background areas from your images. The Crop tool lets you easily crop out unwanted elements from your picture using seven predefined guideline choices. And, if you have a lot of information onscreen, you can zoom in or out using the Zoom tool, and then crop out just what you need using the Crop tool. You can crop between any two points on your picture. Broadly speaking, there are two types of tools: where you set the color and where you set the location of the color to be applied. You can set the color within the Stroke or Appearance or both; you can also set the location of the color by adjusting horizontally or vertically or both in the Appearance or Tool settings. (You might be surprised at the number of options available once you open the Appearance or Tool properties window, which you can click to open from the right-click menu or from the top of the dialog box.) 933d7f57e6
