Thanks for the review. I am not sure you noticed but there is a small act of kindness to authors. The author of this review was given an ad removed feature as consolation. Authors get a free ad remove feature. Lightroom's Data Management capabilities are quite new, but they already give me the hope that it could replace cmyk files. Lightroom is a good example of Adobe taking advantage of computer processing power. This is considered a beta release, and it already offers an incredible amount of flexibility. It is easy to see how some advanced users will be able to expose this capability within the workflow. If you are taking pictures for an art project, I would recommend your use Lightroom as opposed to Photoshop. However, for the most part, I still prefer Photoshop, as its style engine is far better suited for such photo composites. In Lightroom you get to choose Fidelity options. The default is Display, but when working in Lightroom you can opt for the high-fidelity Display Fidelity, HDR Replacement or Display Intent Fidelity. To me, the HDR Replacement setting is the most elegant, though Display Fidelity looks sensible. On the other hand, HDR Replacement looks like it is designed for photographs taken from DSLR cameras and post-processing, as the camera, lens and lighting makes HDR look more natural than any standard Fidelity options in Lightroom. In fact, HDR Replacement looks so good that I am tempted to change my default settings for every new image. For what it's worth, HDR Fidelity seems to get the hues right most of the time. Still, I believe that a decision that relies on the profiler of the camera is not one that we should make for individual users. I would consider looking at the HDR Fidelity options and choosing one that looks suitable for photos you take yourself.
