What I think will really push Adobe to keep developing Photoshop is the effect of the emergence of smartphones. At the moment Photoshop is still a bit of an exclusionist tool but I'd imagine investors in Adobe have recently taken note of the fact that the vast majority of people carry a mobile phone in their pockets on a daily basis. They can't all use a laptop and a tablet, though, with wireless technologies and the increasing ubiquity of laptops. In a world where you can now shoot and edit your own 4K video on the go (obviously that isn't a new medium but it's become increasingly commonplace) and share it with the world through social media, a desktop or laptop can be a bit of an anachronism. It just won't cut it. This could also be where Adobe needs to square its perspective of using Photoshop and Elements as a tool for hobbyists when it launched the Creative Cloud back in 2013. On the one hand, it wants to ensure that people don't want to pay for lightroom because "it's free", on the other hand, it needs to make sure that people know there are solutions and competition out there for those who want to use its tool without paying. On the desktop platform, however, Photoshop is one of the most powerful tools around. You'll need a powerful computer to properly use the program but you can get away with buying old tech that's just waiting to be turned into a powerhouse. The biggest drawback is that you can't integrate Creative Cloud during the trial period (which is where you can really see Photoshop in action on your HD 720 or 1080 video, which gives you a clear idea of the potential). Although the layout and interface of the application still holds up well, you'll need to knock the price up quite a bit for the convenience of being able to access all of Photoshop's features.
