The latest version of Lightroom for the PC contains a single new feature: "Memory Fix," as described earlier. That's the only memory-intensive feature you'll notice in the updating. Other than that, Lightroom is very stable. For someone like me who has only a few hundred images at any given time, Lightroom 5's scan and archive features are very powerful and efficient. Although I've been using Lightroom for more than five years now, I've never felt like I was using anything other than a flagship version of the software. In other words, it's well known for being a great tool. I thought I would be able to do decent work with Lightroom 5 and I haven't been disappointed. In fact, while I was building this review, I actually ran copies of 5.0 and 4.3 on two different laptops to compare the two. I concluded that Lightroom 5, although visually much more attractive, does not appear to be technologically superior. Also, in a sense, it's more of a proof of concept than a full-fledged

application. To sum up, I think that Adobe did well with Lightroom 5 by adding powerful new tools for less experienced users who do not want to use Photoshop, but prefer to work on images without slicing out a part of the picture. It seems likely that the introduction of the new Rich Text Format, with its bold, italic and hyperlinked media, can only fuel the growing information movement. Although all that internet chatter is really just noise to me, as it fails to convey at least some direct relevance to my professional life. I am interested in the new API for Adobe ExtendScript first and foremost because I think that this will make it even easier for programmers to integrate Lightroom functionality into their own projects. I saw a new plugin interface that is somewhat different from the usual one but, unfortunately, I did not find out how it was implemented. I do not use Lightroom for my "raw" conversion, so I have no real interest in the new RAW and DNG converter, but perhaps this tool could work even better than before if the company decided to invest more of its resources and time in it. All in all, there is something interesting and new to try out in Lightroom 5, even if there are some features which may make people wish to stay with Lightroom 4 for the time being.

The Eraser tool is a non-destructive editing tool that allows you to remove dust, scratches, blemishes, and unwanted portions of the image. This is very helpful when you are working with a small amount of image space because the Eraser tool allows you to remove such problems with a single stroke. **What It Does:** The Spot Healing Brush tool or Spot Healing Tool, is like the Eraser tool in that it allows you to remove unwanted portions of a photograph. A bit more powerful than the Eraser tool, the Spot Healing Tool allows for more sophisticated healing with greater control. The Spot Healing Tool is also known as the Magic Wand tool. It has a threshold setting that allows you to easily determine the area of your image that will be affected by your selected tool. **What It Does:** The Pen tool is used to draw the outlines of Artistic effects, or to define and create compound shapes. The Pen tool is not a line or shape tool, only a drawing tool. **What It Does:** The Magic Wand tool or a selected tool can be used to select, on-the-fly, most of the area in your image. This means it can be used to select messy objects, such as when selecting unwanted feathers on a bird. **What It Does:** The Gradient tool allows you to create a gradient from a single color that can be applied to any area of your image. The Gradient tool is very powerful, and it is often used to create shadow or highlight gradients.

1.5 trillion pixels more, thanks to Adobe Photoshop for iOS. Apple iOS 9 and iOS 10 users now have access to important TIFF support supplements built into the Photoshop application. The oldest version works with any take on the format, while the new version sets a few standards the company says will be adopted in ISO compliance. Adobe aims to offer more features natively in the future. Adobe Photoshop for the Web now fully supports the full range of highly optimized WebP photoscales via QuickLZ compression. Buttonless editing in Photoshop now includes a zooming option. There's also a new stylish radial gradient mask for radial-based effects. Media Encoding Suite 5.4 allows more options for output encoding. In a move that could eventually replace Photoshop, Adobe Keynote has been merged with its rival, Project. Both are part of the Creative Cloud. The keynote suite now supports more third-party file format import and export, and adds a new one-click QuickTime export function. You can also access Photoshop brushes from Keynote and add them to a new Keynote user interface. Adobe has added a new visual editor for the software's Dynamic Link library that can handle tens of thousands of links for web and social presences. More importantly, the company has added new rendering tools for topologies for 3D pipelines. In addition, Photoshop now has an auto save -to-cam feature. The feature is designed to automatically save in case you need to immediately edit your previous work. This is Photoshop's first feature of its nature.

Adobe intended to meet the web needs of its users. It gave the web users the most basic features of Photoshop — such as selection and content-aware fill — in a highly intuitive web interface. Thanks to Industry-standard web technologies, this interface works across platforms, is highly scalable and designed to fit any screen size. My favorite feature in Photoshop CC is the Content-Aware-Fill. I used to use Adobe Fireworks in the past but it lacked this feature. In fact, most web designers and photographers don't know about this feature. When I saw in the website that you can download a free license of Photoshop, I couldn't wait. However, my wait was not in vain. I love this feature and the added bonus is, the users can download this free license with a 4 week trial period. It's about time that the designers and photographers get the features which they require. Adobe should have started with sharing images and post-processing on web pages. That is where, most of the users will consume the images. As web designers, we are mostly aware of the web client that we use to self-host the content. Adobe is a pioneer of the digital media and we should use the same technologies for web use. It's good to have two different versions of tools. We should have a separate tool for web use and another one for the desktop. The web-tool should be based on web technologies and make use of those technologies to enable us as designers. Using web technologies is perfectly fine and there is no need to reinvent the wheel.
