Adobe Photoshop often is considered more of a photo workflow tool than a true editing app, so it's no surprise that there isn't a dedicated video editing function. You can import your projects from the free Elements, but the only way to export it back out is as a JPEG file. The most you can do is edit the files in Elements and then share them as Projects. This is really nice, and I'm going to need to use it often. This is an editing app in an app environment, but let's face it, you'll never use the app to edit. Really, the app feels like an app - it's got menus and layouts with back and forward buttons, it has options and submenus, and it feels very much like the other Photoshop apps. Adding a new creative option like Imagemagick might just wake some people up to how far things have come. The other applications have improved, too; I find I can use Lightroom as a PostCrop app without too much pain, and I can get simpler video editing done in Instagram. The real trick is whether the Creative Cloud will get some prestigious design chops when that interface is designed, because it's bound to be impressive at that point.

To begin, select a layer that you want to reapply the blending option effects on. Alternatively, you can select the entire document. In the blending options window you can see all of your blending types. For this example, we will be selecting the color adjustment. Again, you can select multiple layers and provide different blending options for each of them. When you select the first blending option, the icon will change to a targeted arrow. Now, using your phone camera, tap to open the app, take a picture of a scene around you. Why popup it? If you don't need to use the camera of your phone to perform this process you can skip this step. When you're back in your phone with the camera, tap the app to open it to see the blended photos you captured. If you wait a short while, the app will start offering you a bunch of options to help you use the newer features on the mobile app, like retouching, bokeh, and effects. Within each category of tool, you can select the individual tool you need. The image shown here was retouched with a bokeh tool and the brush made with the Shape layer. Keep in mind that the photo editing tools and effects that you see in the mobile version will work differently on the web, and there are some additional features that are only available with desktop. You will find that all of the layers inherit the blending options, and this is great, because you want to try blending different options on different projects. If you are doing a presentation, some of the blending options don't apply; if you are designing a web page, other options don't apply. e3d0a04c9c
